Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

John is a fitness trainer, and he wants to use the BMI calculator to assess the body mass index of his clients. He has a list of clients based on their height and weight.

John plans to write a program to quickly determine the BMI and provide a classification for each client.

If BMI is less than 18.5, the program will classify it as "Underweight" If BMI is between 18.6 and 24.9, the program will classify it as "Normal Weight" If BMI is between 25.0 and 29.9, the program will classify it as "Overweight" If BMI is 30.0 or higher, the program will classify it as "Obese"

Note: Formula to calculate BMI = weight/(height*height)

Input Format

The first line of input consists of a double value, representing the height of the person in meters.

The second line consists of a double value, representing the weight of the person in kilograms.

Output Format

The first line of output prints "BMI: " followed by a double (rounded to two decimal places) representing the calculated BMI.

The second line prints "Classification: " followed by a string indicating the BMI category (Underweight, Normal Weight, Overweight, or Obese).

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1.2

45.2

Output: BMI: 31.39

Classification: Obese

Answer

```
import java.util.Scanner;
class BMICalculator {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        double height = sc.nextDouble();
        double weight = sc.nextDouble();

        double bmi = weight / (height * height);
        String classification;

        if (bmi < 18.5) {
            classification = "Underweight";
        } else if (bmi >= 18.6 && bmi <= 24.9) {
            classification = "Normal Weight";
        } else if (bmi >= 25.0 && bmi <= 29.9) {
            classification = "Overweight";
        } else {
```

```
        classification = "Obese";
    }

    System.out.printf("BMI: %.2f Classification: %s%n", bmi, classification);
}
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

Ted, the computer science enthusiast, has accepted the challenge of writing a program that checks if the number of digits in an integer matches the sum of its digits.

Guide Ted in designing and writing the code to solve this problem using a 'do-while' loop.

Input Format

The input consists of an integer N, representing the number to be checked.

Output Format

If the sum is equal to the number of digits, print "The number of digits in N matches the sum of its digits."

Else, print "The number of digits in N does not match the sum of its digits."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20

Output: The number of digits in 20 matches the sum of its digits.

Answer

```
import java.util.Scanner;
class DigitMatchCheck {
```

```
public static void main(String[] args) {  
    Scanner sc = new Scanner(System.in);  
    int N = sc.nextInt();  
  
    int temp = N;  
    int sum = 0;  
    int count = 0;  
  
    do {  
        int digit = temp % 10;  
        sum += digit;  
        count++;  
        temp /= 10;  
    } while (temp > 0);  
  
    if (sum == count) {  
        System.out.println("The number of digits in " + N + " matches the sum of  
        its digits.");  
    } else {  
        System.out.println("The number of digits in " + N + " does not match the  
        sum of its digits.");  
    }  
}
```

Status : Correct

Marks : 10/10

3. Problem Statement

Samantha is a diligent math student who is exploring the world of programming. She is learning Java and has recently studied conditional statements. One day, her teacher gives her an interesting problem to solve, which takes a number as input and checks whether it is a multiple of 5 or 7.

Help her complete the task.

Input Format

The input consists of a single integer N, representing the number to be checked.

Output Format

If the number is a multiple of 5 but not 7, the output prints "N is a multiple of 5".

If the number is a multiple of 7, the output prints "N is a multiple of 7".

Otherwise the output prints "N is neither multiple of 5 nor 7" where N is an entered integer.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10

Output: 10 is a multiple of 5

Answer

```
import java.util.Scanner;
class MultipleCheck {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int N = sc.nextInt();

        if (N % 5 == 0 && N % 7 != 0) {
            System.out.println(N + " is a multiple of 5");
        } else if (N % 7 == 0) {
            System.out.println(N + " is a multiple of 7");
        } else {
            System.out.println(N + " is neither multiple of 5 nor 7");
        }
    }
}
```

Status : Correct

Marks : 10/10

4. Problem Statement

Maya, a student in an arts and crafts class, wants to create a pattern using stars (*) in a specific format. She plans to use a program to help her

construct the pattern.

Write a program that takes an integer as input and constructs the following pattern using nested for loops.

Input: 5

Output:

```
*
```

```
**
```

```
***
```

```
****
```

```
*****
```

```
****
```

```
***
```

```
**
```

```
*
```

Input Format

The input consists of a number (integer) representing the number of rows.

Output Format

The output displays the required pattern.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: *

```
**
```

```
***
```

```
****
```

**
*

Answer

```
import java.util.*;  
class maya{  
    public static void main(String[] arg){  
        Scanner g=new Scanner(System.in);  
        int a=g.nextInt();  
        for(int i=0;i<a;i++){  
            for(int j=0;j<i;j++){  
                System.out.print("* ");  
            }System.out.print("\n");  
        }  
        for(int i=a;i>0;i--){  
            for(int j=i;j>0;j--){  
                System.out.print("* ");  
            }System.out.print("\n");  
        }  
    }  
}
```
